1 Introduction

The process of building annotations for image-segmentation datasets is long, tedious and often expensive. Domain experts may be willing to build the annotations, but may lack the time resources to familiarize themselves with complex GUIs. LivePyxel is a Python library that integrates a user's webcam with an annotation tool.

2 Features

The main features of LivePyxel are:

- Real-time image segmentation.
- User-friendly interface.
- Webcam integration.
- Modular in design for easy add on installation

3 Installation

Installation instructions go here.

4 Usage

How to use LivePyxel.

5 API Reference

API documentation.

6 Examples

Example usage scenarios.

7 Troubleshooting

Common issues and solutions.

8 Conclusion

Concluding remarks.

9 Specifications

The following technical specifications declare the scope and modular integration of the LivePyxelibrary.

9.1 Modules

The core functionality of the LivePyxelsoftware is encapsulated within the following modules:

- **constants** - Initializes constants and structures accessed across modules.
- **ImageAnnotator** - Handles annotation, video capture and UI integration.
- **Bezierman** - Bezier spline manager.
- **Polyman** - Polygon tool manager.
- **UIMainWindow** - Contains the main user interface elements.
- **VideoDeviceManager** - Handles video device initialization and image saving.
